Introduction

Tennessee, like the nation, is in the midst of a manufacturing renaissance. After years of trend decline and additional disruptions from the recession of 2001 and the Great Recession of 2007–2009, manufacturing employment has been on a rebound since 2011. Unfortunately, these employment gains are expected to be short lived. The long-range outlook for Tennessee projects employment in the state’s manufacturing sector will once again contract starting in 2018. The outlook for the U.S. manufacturing sector is modestly more optimistic with employment expected to continue to expand through 2019. Despite the anticipated return to trend decline, there will continue to be new employment opportunities in manufacturing through the expansion of existing establishments and the entry of new firms, and through worker quits, separations and retirements.

New manufacturing establishments will continue to emerge, replacing older and less productive facilities, and supporting new product lines. But like employment, the overall trend is expected to reflect a net balance of fewer and fewer firms in the manufacturing sector. And these firms will be smaller than their predecessors. These are well-established historical patterns for Tennessee, other southeastern states and the nation, dating back to 1990 (based on NAICs data). Despite the current resurgence in manufacturing employment, the historical pattern of declining establishments is unlikely to be reversed in any significant way.

As these trends in employment and establishments transpire, manufacturing output is expected to continue to grow at a healthy pace. Strong output growth, ultimately coupled with fewer workers and fewer firms, means that the manufacturing sector will continue to benefit from especially strong gains in productivity as measured by output per worker. Businesses continue to make substantial investments in computer hardware and software, as well as

equipment; investment in structures and overall capacity, on the other hand, will remain weak for the next several years. These investments in computers and equipment will allow businesses to be more competitive as they seek to meet the needs of their customer base. An important part of the competition paradigm entails using more highly-skilled labor as a complement to more advanced production technologies to produce both basic and more sophisticated products.

The future of manufacturing is a mixed bag for Tennessee and the nation. While there will be fewer employment opportunities and fewer manufacturing establishments, new opportunities for workers, entrepreneurs and communities will endure. These new opportunities will evolve and look less and less like the “old” manufacturing sector of just 20 or 30 years ago. Importantly, the competition for manufacturing jobs and the tax base associated with firms will continue to be intense. The intensity of the competition and the rapidly changing needs of modern manufacturing firms, especially in terms of skilled workers, will require ongoing adaptation of policy intended to foster industrial growth. As the pace of change in manufacturing accelerates, so too must the policy support network.

The remainder of this report is organized as follows. The next section provides a broad overview of trends in manufacturing with special focus on the ongoing manufacturing renaissance. Subsequent sections examine employment and establishment trends, the outlook for manufacturing production, productivity gains and Tennessee’s manufactured export markets. The analysis presented here will help frame the review and development of economic development policies intended to foster stronger growth in Tennessee’s manufacturing sector.

Manufacturing in the Post Great Recession Era

Previous reports on the Tennessee manufacturing sector developed by the Center for Business and Economic Research have documented broad trends in industrial development and major drivers of industrial change for the nation and state. The first report, *The State of Manufacturing in Tennessee* documented statewide and substate trends in employment, establishments, earnings and production. The second report, *Looking for Opportunity in Tennessee's Manufacturing Sector*, provided an update on industrial development patterns for the state, discussed broad forces like technological change and global competition that were reshaping the manufacturing sector and sought to identify industries with especially strong contributions to the state economy. The broad patterns and insights from these reports generally remain valid today.

At the same time, much has happened in the intervening years since these reports were issued—most notably the Great Recession which started in December 2007 and ended in June 2009. The peak-to-trough contraction associated with the recession was the longest since the onset of the depression in August 1929. The Great Recession was also the deepest contraction since the 1930s. Most recessions are short-lived, and when they end the economy generally returns relatively quickly to pre-recession levels of economic activity. That is certainly not the case with the Great Recession. While the recession ended well over four years ago, many key measures of economic activity—including nonfarm employment, manufacturing employment and investment in residential housing—are still below pre-recession levels. The recession will continue to have ripple effects that carry through the current decade.

Everyone is aware of the fact that the economy is fundamentally different today than it was in 2007 at the onset of the recession. Unfortunately, because we are in the midst of an ongoing transformation, it is hard to have clarity about why economic conditions are what they are, or what the future has in store for the economy. But we can be certain that the economy has changed and changed remarkably. And we can also be certain that more rapid change is on the horizon.

One of the remarkable transitions underway is the manufacturing renaissance that is taking place in Tennessee and across the nation, seen most visibly through ongoing monthly employment gains and anecdotally through the emergence of sophisticated production technologies such as additive or 3D manufacturing. Some degree of rebound from the trough of the recession was to be expected. But few, if any, foresaw this longer-term trend emerging just 10 years ago. The globalization of the economy and its attendant competitive forces were expected to lead to

steady employment losses for domestic manufacturing, though output was expected to grow as a result of technological change and the adoption of productivity enhancing production processes. Nonetheless, the anticipated employment losses were expected to have dire consequences for many workers and communities. Instead we are witnessing robust growth in manufacturing output and strong growth in employment. Unfortunately, the positive employment trend will reverse itself before decade's end.

The broad forces affecting industrial activity 10 years ago are still at play today. So what has changed? At this point one may only speculate. One explanation is that domestic manufacturers want production to be closer to where top-level management and corporate headquarters reside. The general rationale is that this facilitates quick and effective decisionmaking and a greater capacity to monitor domestic supply chains. A second and related explanation is that some firms want R&D and product design (often sourced domestically) to be more closely linked to where production takes place. In a market environment that is changing rapidly, this will help position firms to change product lines quickly in response to changing consumer tastes and the emergence of new products.

Another argument is that firms have simply found foreign production markets to be less hospitable than they had hoped. While production offshore can engender cost savings, these same cost savings need not translate into lower per unit production costs. Workers abroad often have less formal education and on-the-job experience, infrastructure can be less reliable and protection of intellectual property rights may be compromised. While there are many good reasons to operate offshore production facilities, there are also limits to the viability of many offshore sites, especially in developing countries. Offshoring of production also creates lag times in getting final products to domestic consumers, a problem that is more serious for large, bulky products that require ocean shipping.

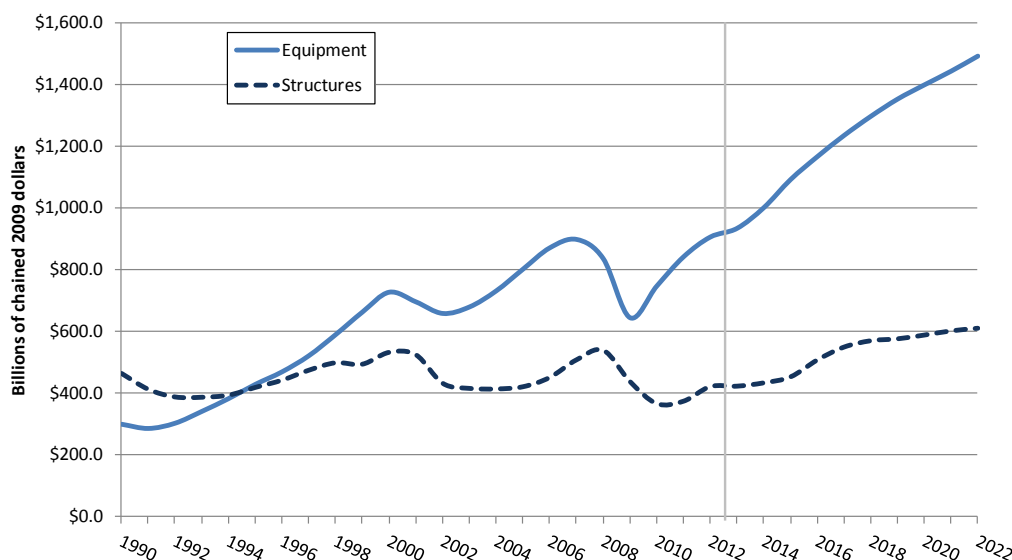

Finally, domestic firms have been especially aggressive in investing in computer hardware, software and equipment that has greatly enhanced their productivity. As shown in Figure 1, real investment in equipment and computers has surpassed pre-recession levels. And note that investment in equipment and computers showed strong growth even before the end of the recession. At the same time, investment in structures has struggled to engineer any meaningful growth and current levels fall well below the levels that prevailed before the recession.

It is important to recognize that this strong growth in equipment investment took place at the same time that

nonfarm and manufacturing employment in the U.S. and Tennessee were still contracting. The investment in equipment and computers has likely retarded employment growth as firms have sought to reduce their labor costs while pursuing productivity and competitiveness gains. This substitution of equipment and computers for employment is masked in the data that show ongoing

employment gains in manufacturing. The skill mix of employment has likely been changing as well (though this is difficult to measure directly) as higher technology production processes generally require greater worker skills and training.

Manufacturing Employment Trends

Manufacturing employment as a share of nonfarm employment has been trending down for the nation, the southeast and Tennessee for many years. The level of manufacturing employment, on the other hand, saw some growth in the 1990s and then returned to growth in 2011. The current employment gains in manufacturing are not viewed as sustainable over the longer term and the short-term growth will not make up for all of the losses that transpired over the course of the recession.

Figure 2 shows manufacturing employment as a share of nonfarm employment dating back to 1990, with projected data for Tennessee and the nation extending out to 2022. (Projections for the southeastern states are not available.) There is no interruption in the trend

decline until after the sharp dip associated with the Great Recession, and then there is only very small improvement for Tennessee and the U.S. in the immediate aftermath of the recession. While most sectors of the economy suffered during the recession, the losses in manufacturing were especially pronounced. For example, in 2009 Tennessee nonfarm employment fell 5.6 percent but manufacturing employment fell 14.3 percent. The short-term growth in the manufacturing share of nonfarm employment is due to strong gains in manufacturing and anemic overall employment gains. In 2012, manufacturing employment expanded at a robust 3.0 percent pace while nonfarm employment was up at the slower but respectable rate of 2.0 percent.

Historical and projected levels of manufacturing employment, including durable goods and nondurable goods manufacturing for the U.S. and Tennessee, are illustrated in Figure 3. Note that in 1990, durable goods and nondurable goods manufacturing each accounted for roughly the same number of jobs in Tennessee while there was a more significant disparity for the nation. The state's strong growth in durable goods employment in the 1990s which arose largely from the transportation equipment sector has helped increase the wedge between durable goods and nondurable goods employment. The overall patterns for the state and nation are remarkably similar illustrating how closely integrated the respective economies are. It is also clear that the pattern of short-term resurgence is not expected to persist over the longer run.

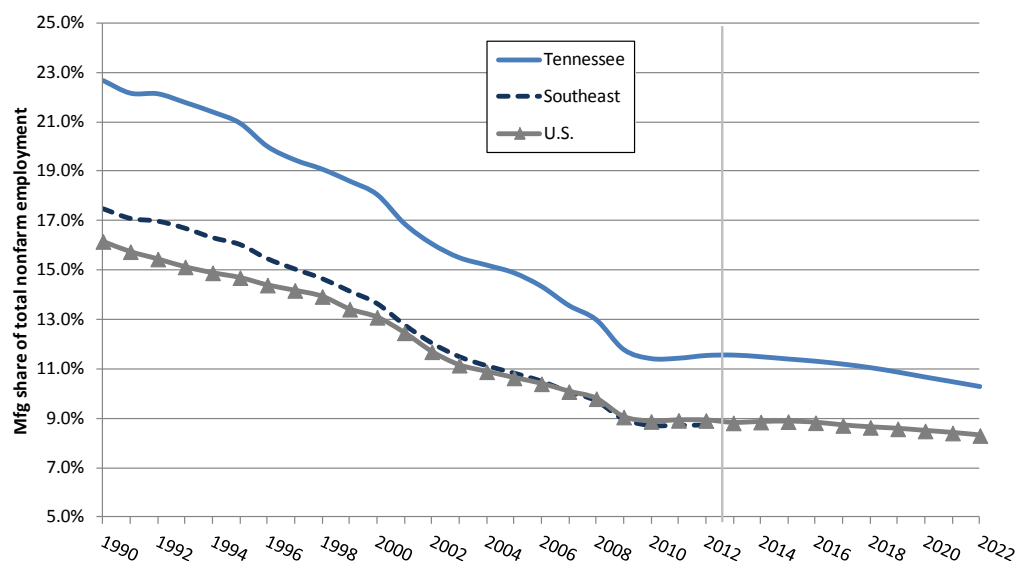

The cyclical nature of the manufacturing sector is also revealed in Figure 3. The U.S. and state economies were in recession in 1990–1991, 2001 and 2007–2009. Clear and pronounced dips in durable goods employment appear during these recessionary periods and the effects ripple through to overall manufacturing. Nondurable goods, on the other hand, show much less sensitivity to the business cycle. This reflects the fact that durable goods are assets that produce a flow of services, as with machinery,

automobiles and appliances. Nondurable goods, on the other hand, include consumables like food, beverages and clothing products that have shorter life spans and are consumed more quickly than their durable goods counterparts.

Detailed historical and projected data for durable and nondurable goods manufacturing are reported in Table 1. These detail help shed light on the broad trends discussed above. From 1990 to 2007, overall manufacturing employment fell from 500,600 jobs to 379,900 jobs. The losses in durable goods manufacturing were modest, totaling only 20,900 jobs. Nonmetallic minerals, machinery and transportation equipment were the only sectors that were able to add to payrolls. Losses in nondurable goods employment came in at 99,800 with only the plastics and rubber sector eking out a small gain. The largest setbacks were related to textiles products where employment fell from 81,100 in 1990 to 15,100 in 2007.

Between 2007 and 2013 manufacturing shed 60,100 jobs, reflecting significant setbacks in 2008–2010. In 2009 alone, manufacturing employment fell at a 14.3 percent rate as noted above. Employment turned around in 2011, with gains in cyclically-sensitive durable goods employment overcoming continued losses in nondurable goods employment. In 2012 and 2013, both components

of manufacturing enjoyed growth. On balance, few subsectors saw growth during the 2007–2013 window: transportation equipment, food products, beverage and tobacco products and miscellaneous nondurable goods. The rebound in transportation equipment is rather remarkable given the steep losses over the recession. The rebound is consistent with U.S. light vehicle production returning to near pre-recession levels.

The altered employment distributions across 2007 to 2013 for U.S. and Tennessee durable goods manufacturing and nondurable goods manufacturing are shown in Figures 4 and 5. One of the most striking features of Figure 4 is the large increase in the share of Tennessee manufacturing employment in the transportation equipment sector, growing from 24.7 percent in 2007 to 29.4 percent in 2013. The explanation is straightforward: transportation equipment employment in Tennessee has recovered and surpassed levels that prevailed in 2007 while all other sectors of durable goods manufacturing have contracted. Note that the U.S. share of durable goods employment in transportation equipment also grew between 2007 and 2013, but only by a small amount. Other sectors within durable goods have seen much smaller shifts in their allocation of employment.

The employment distributions for nondurable goods employment appear in Figure 5. Most slices of the pie are similar for the U.S. and Tennessee in 2007, with the largest difference attributable to plastics and rubber which is slightly more dominant in Tennessee (18.6 percent versus 14.9 percent for the U.S.). The changes from 2007 to 2013 are in most instances quite modest. Food products show relatively large gains for both the state and the

nation. For Tennessee, one reason for the growing share is that employment in the food sector grew by 600 jobs while overall employment in nondurable goods manufacturing contracted. Printing-related employment saw a significant decline in its employment share in Tennessee and a somewhat smaller decline for the U.S. Printing-related employment in Tennessee fell from 17,000 in 2007 to 8,900 in 2013.

Table 1, referenced above, shows the long-term employment outlook extending to 2022 for each broad subsector of durable and nondurable goods manufacturing. Overall manufacturing employment will continue to grow in Tennessee through 2017 and for the U.S. through 2019. In the following years employment will return to trend decline. Total manufacturing employment will fall at a 0.2 percent compound annual growth rate between 2013 and 2022, with a 0.6 percent gain in durable goods offsetting a 1.4 percent decline in nondurable goods. On net, manufacturing employment in 2022 is projected to total 315,500, with 210,200 jobs in durable goods and 105,200 jobs in nondurable goods. Compared to 2013, this is a decline of 4,300 jobs for overall manufacturing, a gain of 10,200 jobs for the durable goods sector and a loss of 4,600 jobs for nondurable goods manufacturing.

Within durable goods, growth is expected for primary metals, fabricated metal products, machinery, electrical equipment, transportation equipment and miscellaneous durable goods. The only sector within nondurable goods that is expected to see employment gains is plastics and rubber products. Employment in textile-related sectors will almost be halved.

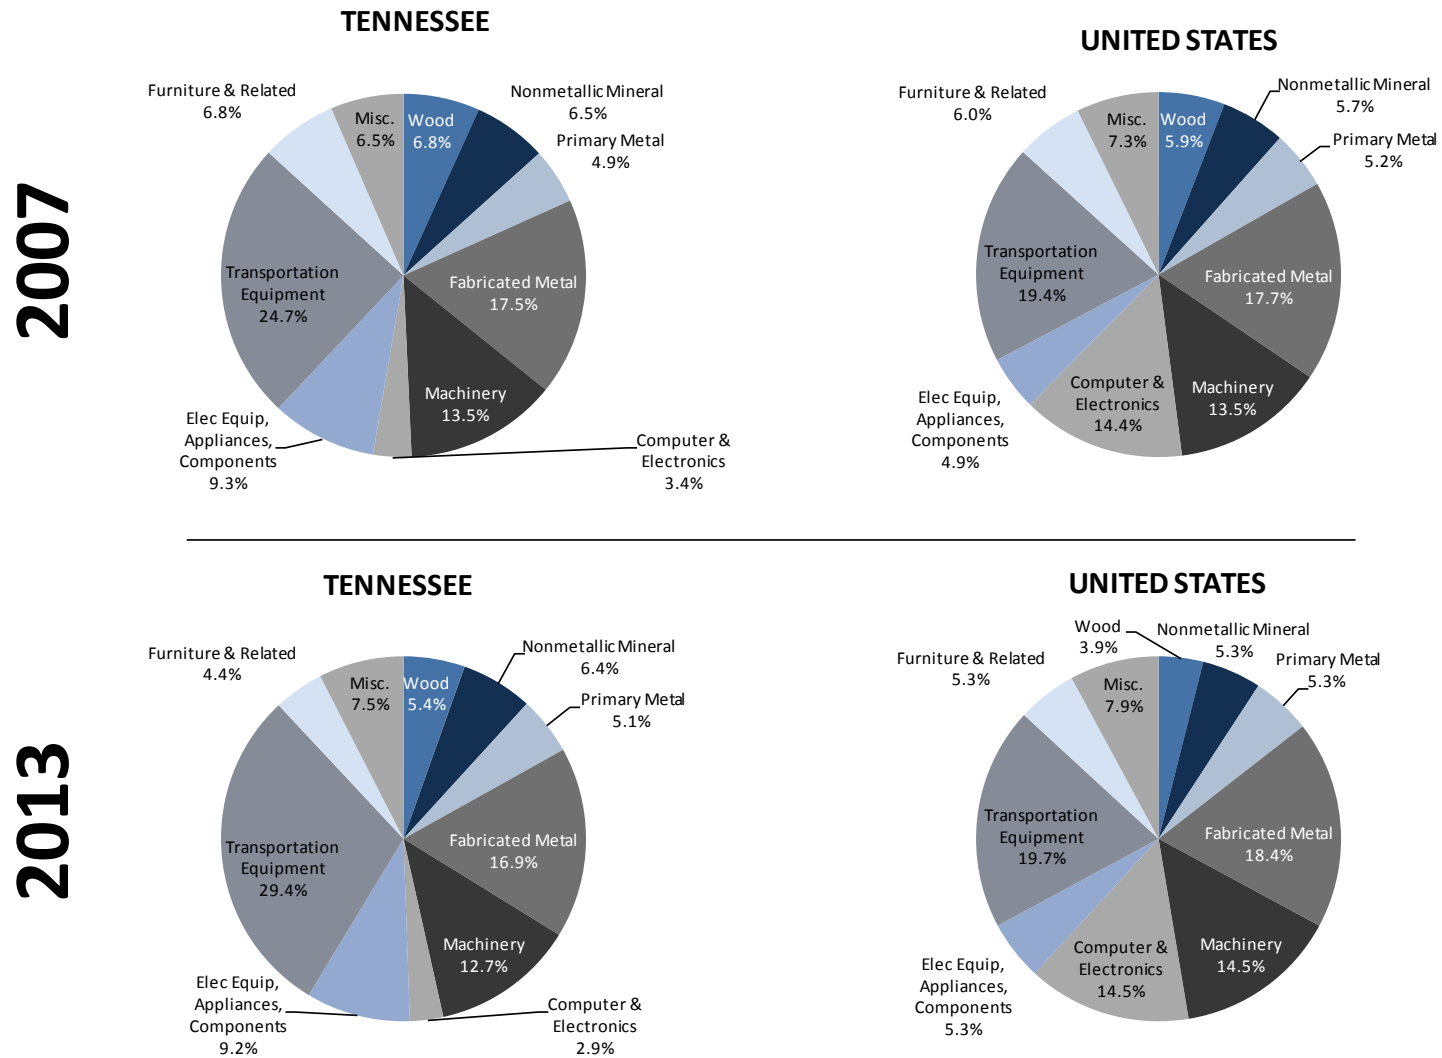

The Spatial Distribution of Manufacturing Employment Across Tennessee

Manufacturing employment in Tennessee tends to be higher in more populated counties of the state. However, as a share of nonfarm employment, manufacturing is more densely concentrated in rural communities where other sectors like services and retail trade are less prominent. (Detail on county employment levels are provided in the appendix to this report.) Perry County had the largest manufacturing employment share in 2007 with an

astounding 49.3 percent of all jobs in the industrial sector; Meigs County had the largest share in 2013 at 48.3 percent. Among those counties with small or inconsequential manufacturing shares in 2013 are Lake, Moore, Sevier and Williamson Counties. Lake and Moore counties are small and relatively isolated while Sevier and Williamson Counties have chosen to focus on sectors other than manufacturing as engines of economic development.

To provide a pre- and post-recession perspective, Figure 6 shows the concentration of manufacturing employment as a share of nonfarm employment for Tennessee counties and development districts for 2007 and the first quarter of 2013. The decline in manufacturing employment shares is clear when comparing the shading across the two maps. Every development district witnessed at least one county

moving to a lighter shading over the period shown. By the first quarter of 2013, development districts 1, 2 and 5 no longer had any counties where manufacturing accounted for more than 40 percent of nonfarm employment. The 6th and 9th development districts each had one county move into the red category, though some other counties in the same districts did see manufacturing shares fall.

Figure 6: Manufacturing Employment as a Share of Total Private Employment, 2007 to 2013Q1, Hit Hard by Recession

Source: Bureau of Labor Statistics.

Manufacturing's Contribution to State Gross Domestic Product

Inflation-adjusted manufacturing output grew at a stronger pace than overall state gross domestic product (GDP) between 2000 and 2007 but underperformed relative to state GDP between 2007 and 2013 because of the depth of the recession in the industrial sector. Barring another recession, manufacturing output will grow at a faster rate than GDP between 2013 and 2022.

Recent historical data and long-term projections for output and output growth for the state's manufacturing sector are reported in Table 2. Output in durable goods manufacturing has been substantially higher than in nondurable goods manufacturing and this wedge is expected to increase by 2022. The growth in computer and electronic products between 2000 and 2007 is staggering,

especially when seen in light of the ongoing job losses in this sector. (The last time computer and electronic products saw employment grow was in 2000.) Between 2007 and 2013, output growth slowed under the weight of the recession. But growth continues to rebound from

the recession's trough. Machinery and transportation equipment will enjoy the strongest growth by 2022 and help buoy overall durable goods production. Output in the furniture, textile and printing-related sectors is expected to contract between 2013 and 2022.

Table 2: Manufacturing Output Grows Briskly Despite Employment Setbacks

Manufacturing Output and Worker Productivity

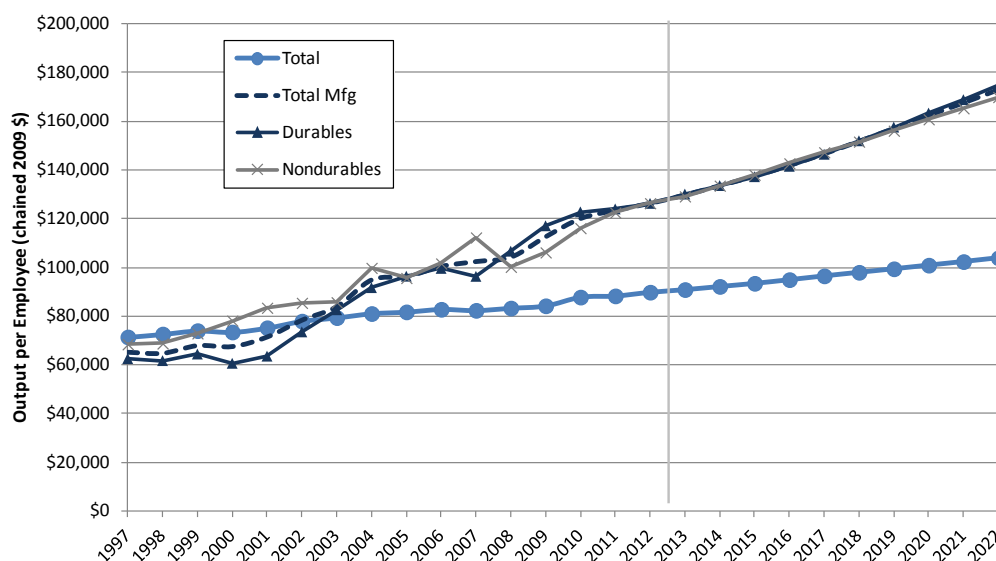

Output growth in the manufacturing sector has benefited from productivity improvements that have come about as a result of new capital investment and the employment of a more highly skilled workforce. Part of this pattern reflects the industrial mix and a shift in what is produced in Tennessee. A good example is the transition away from the labor-intensive production of apparel products to the capital-intensive production of transportation equipment. Thirty years ago, apparel products that were made in Tennessee faced little competition, at least from offshore producers, and relied primarily on unskilled labor. As offshore competition and low-cost pressures increased, the industry largely left the state for lower-cost locations abroad. In the 1980s, transportation equipment emerged in Tennessee as a competitive sector that could stand up against both foreign and domestic competition. This was achieved by adopting state-of-the-art production technologies, hiring better trained workers and embracing new managerial practices.

Regardless of what a firm produces, new capital investments in equipment, computer hardware and computer software can enhance firm productivity and competitiveness. Unfortunately, there are no hard data on these private sector capital investments at the state level. But one can infer from national patterns of investment (see,

for example, Figure 1) that the same thing is taking place in Tennessee. It is clear that the manufacturing sector has been able to engineer strong productivity gains and much stronger productivity gains than the overall economy. Output per worker in manufacturing was 43.6 percent higher than was the case for Tennessee's overall nonfarm sector in 2013. And between 2000 and 2013, output per worker in manufacturing advanced 90.7 percent versus a much slower 21.6 percent rate of growth for the overall state economy.

Figure 7 provides historical and projected data on production output per worker in manufacturing and total output per total nonfarm worker for the overall state economy. It is noteworthy that both durable and nondurable goods manufacturing had lower output per worker than the overall economy in the mid-1990s. Nondurable goods output per worker surpassed the state average in 1999 while durable goods moved above the state average in 2003. Since then, growth in manufacturing has far outstripped growth in other sectors of the state economy, with a sharp jump occurring during the recession. This exceptional productivity growth is one of the reasons why manufacturing employment growth will not likely be sustained throughout the decade.

Figure 7: Tennessee Output per Employee Shows Significant Gains for Manufacturing

Manufacturing Establishments

The number of manufacturing establishments in Tennessee has continued to fall. The most recent data are for 2011 and thus do not reflect the longer rebound that has taken place in manufacturing. It is highly unlikely that there will be significant growth in establishments in more recent years given the longer-term trend declines that have taken place. Compounding the trend decline is the 27.5 percent collapse and 4.1 percent decline in the national value of manufacturing investment in structures in 2010 and 2011. While investment in manufacturing structures was up 15.1 percent in 2012, levels of investment are still depressed because of earlier setbacks.

Table 3 provides detailed data on the number of establishments within both durable and nondurable goods manufacturing for 2000, 2007 and 2011. Between 2000 and 2007, the number of establishments fell by 364, with durable goods manufacturing losing 61 establishments

and nondurable goods manufacturing losing 30 establishments. Nonmetallic minerals, fabricated metal products, transportation equipment, miscellaneous durable goods and beverage and tobacco products are the only sectors to see growth, led by miscellaneous durable goods.

The data for 2007 to 2011 paint an especially grim picture with the loss of 939 establishments. Beverage and tobacco products gained two establishments while all other sectors contracted. Unlike the earlier window of time shown in the table, durable goods manufacturing bore the brunt of the more recent losses with a setback of 619 establishments versus 320 for nondurable goods manufacturing. Like some of the other data presented in this report, the pattern between 2007 and 2011 demonstrates the high cyclical sensitivity of the durable goods sector.

Table 3: Manufacturing Establishments in Tennessee in Broad Decline

				Change			
	2000	2007	2011	2000 to 2007		2007 to 2011

The establishment trends taking place in Tennessee are placed in a broader context in Figure 8. The data shown here for the U.S., the southeast and Tennessee reflect establishments as a share of total nonfarm establishments. (Note that data prior to 1998 are not directly comparable to subsequent data.) Tennessee has consistently held a greater concentration of manufacturing establishments than the nation and the average across the southeast, and all three geographic regions have seen ongoing setbacks since the mid-1990s.

The number of manufacturing establishments for Tennessee counties and development districts for 2007 and 2012 are shown in Figure 9. Community size is a primary determinant of the number of establishments,

with Shelby County having the most firms in both years, followed by Davidson, Hamilton and Knox counties. Some of the smallest counties, including Lake, Moore and Hancock, had fewer than five manufacturing firms within their borders in each year. These communities have an especially daunting challenge given their relative isolation and the small size and diversity of their regional labor force.

There were 7,304 establishments statewide in 2007 but by 2012 the number had fallen to 6,334. Most counties experienced contraction over the period shown, including the four largest counties. Only seven counties had more establishments in 2012 than in 2007, while eight counties saw no change in the number of establishments.

Figure 8: Manufacturing Establishments as Share of Total Establishments Continue to Fall

Earnings

Tennessee's per capita income and average wage continue to trail the nation. There are several reasons for this long-standing pattern, including the industry/occupational mix (especially historically), cost of living and educational attainment of the workforce. The overall average wage for nonfarm employment in Tennessee stood at \$44,817 in 2012 and projections for 2013 indicate an average wage of \$45,100. As reported in Table 4, the average wage in the state's manufacturing sector was \$54,830 in 2012 which was 22.3 percent above the statewide average. Earnings are highly correlated with worker skills and the amount of productive capital associated with each worker. For the manufacturing sector, workers and firms must be competitive to compete against their rivals in other states and other countries. But

for many other sectors of the economy—including other services, retail trade and leisure and hospitality services—this competition is muted.

It will be a surprise to many that the average wage in nondurable goods manufacturing (\$55,564) exceeds the wage in durable goods manufacturing (\$54,379), though only by a narrow margin. The highest earnings accrue in the paper (\$76,655) and chemical (\$76,000) sectors of nondurable goods manufacturing. Furniture (\$34,351) and wood products (\$34,447), both in durable goods manufacturing, are the lowest-paying sectors. Earnings in these two sectors are below the average wage in the textiles sector (\$36,346).

Table 4: Average Annual Wage and Salary in Manufacturing Well Ahead of Economy-Wide Earnings in 2012 (dollars)

Sector	Amount
Total Nonfarm	\$44,817
Total Manufacturing	\$54,830
Durable Goods	\$54,379
Wood Products	\$34,447
Nonmetallic Mineral Products	\$46,836

Manufacturing Exports

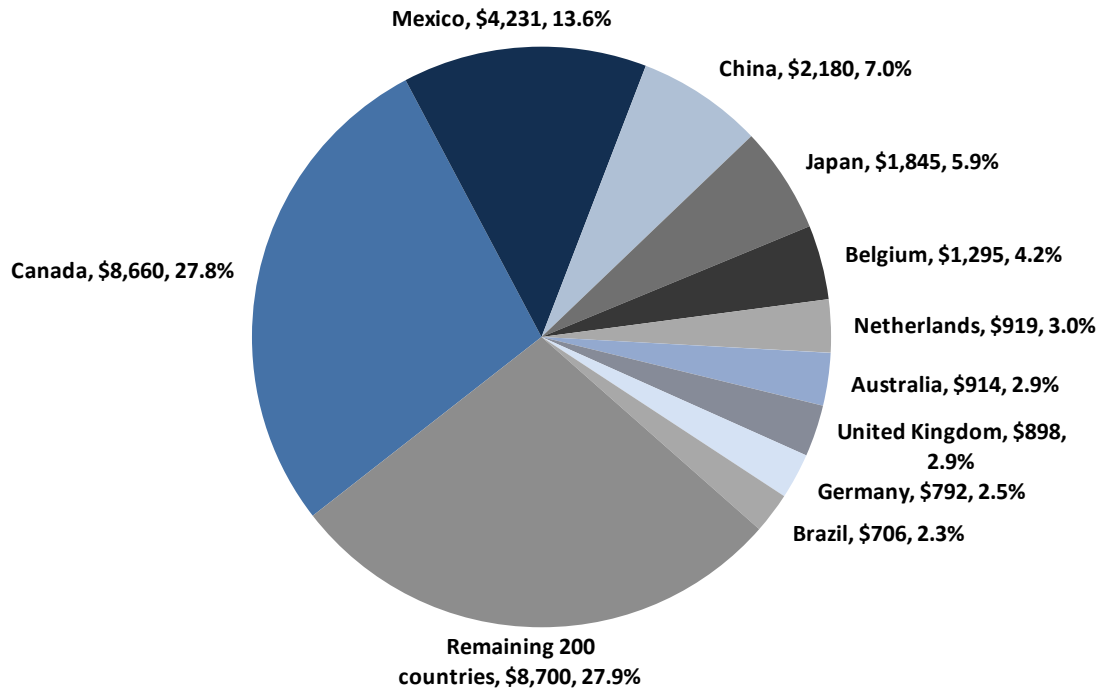

Many Tennesseans are not aware of the extent to which the state economy is engaged in global commerce. Most understand the role of imports since consumers purchase foreign-made products on an ongoing basis. But Tennessee is also the location of substantial volumes of foreign direct investment as well as the production of a wide array of products that are exported abroad. This export activity is a very important direct source of job creation for the state's manufacturing sector and an indirect source of employment via supply chains and the ripple effects of the multiplier. Firms and workers engaged in exporting activity can be viewed as highly competitive by virtue of their capacity to export in a dog-eat-dog global marketplace.

Figure 10 shows the distribution of manufacturing exports from Tennessee in terms of country of import. The largest importer of Tennessee-made products is Canada

which accounts for 27.8 percent of all exports from the state. Mexico comes in second at 13.6 percent, followed by China (7.0 percent) and Japan (5.9 percent). Together these countries alone accounted for 54.3 percent of all manufacturing exports in 2012, representing \$16.9 billion of sales. Medical and surgical instruments and civilian aircraft engines and parts are the top two exports by value. A number of medical-related instruments and parts categories, along with other transportation equipment components categories, also appear prominently in Tennessee's export portfolio.

As shown in Table 5, the employment associated with manufacturing exports from Tennessee was substantial in 2011. For those sectors not subject to data disclosure limitations, employment directly related to exports totaled 41,200. A smaller but still significant number of jobs are supported indirectly by export activity. Transportation

Figure 10: Canada, Mexico, and China Accounted for Almost Half of Tennessee Manufacturing Exports in 2012(millions of U.S. dollars)

Source: U.S. Department of Commerce, Office of Trade and Industry Information, Manufacturing and Services, International Trade Administration.

equipment and machinery dominate exports from the durable goods sector. Within nondurable goods manufacturing, chemicals alone accounts for well over one-half of all reported export jobs.

The relative dependence of each manufacturing subsector on exporting activity is shown in the final column of the table. For some sectors, like furniture and food

products, total export-related employment is a relatively small share of total sector employment. But for some other sectors there are very strong and significant ties to exports. For example, in nondurable goods manufacturing, 45.8 of percent of total employment in chemicals is tied to exports. In durable goods manufacturing, 62.5 percent of all employment in primary metals is tied to exports.

Table 5: 2011 Tennessee Manufacturing Employment Tied to Exports is Significant Source of Job Creation (in thousands)

Sector	Total Manufacturing Employment	Employment Related to Direct Exports	Jobs from Indirect Manufactured Exports	Total Export-Related Employment	
				Employment	Share of Total Manufacturing Employment (percentage)

Conclusion

Tennessee is enjoying the strongest manufacturing employment gains in decades. Employment has advanced each year since 2011 and has outstripped growth in overall nonfarm employment by a wide margin. The nation has also seen strong and unprecedented growth in manufacturing employment. The usual rebound from recession is only part of the explanation for this manufacturing renaissance. It appears that American manufacturers may have found domestically-source production to be favored, at least in some instances, over offshore production sites. The emergence of new products and technologies, from additive printing to robotics, is also part of the story, with a desire to keep this production close to home. While the ongoing rebound is not expected to be sustained, there will nonetheless be several years of continued employment gains in manufacturing for the state and the nation.

Current trends in the manufacturing sector may reflect an underlying transformation of industrial activity in the U.S. and Tennessee. Businesses concerned about labor costs and competitiveness have made substantial investments in equipment and computer technologies that will have a lasting impact on production practices and employment patterns. The dramatic gains in output per worker (Figure

7) are testimony to the effectiveness of these investments. Manufacturing processes are becoming more and more advanced, even to produce the most basic products. And firms are relying less and less on workers, while producing greater levels of output. While these trends are consistent with the longer-term evolution of manufacturing, there is a growing sense that the pace of change has increased markedly.

Manufacturing firms and workers will have to be ever-more nimble in the years ahead to maintain their competitiveness. More rapid changes in products themselves, due to technological change as well as changes in consumer tastes will require that firms respond quickly to capture market share. There will likely be greater focus in the years ahead on the creation of value rather than simply the pursuit of low cost sites for production. Lean manufacturing and cost control will always be important. But many companies have learned from their overseas experience that low costs cannot be the sole basis for production. The winners—firms, workers, communities and states—will be those who can best ensure value added in production to enable effective market competition in this transformed era of manufacturing.
